#### **NEW QUESTION: 1**

An application publishes Amazon SNS messages in response to several events. An AWS Lambda function

subscribes to these messages. Occasionally the function will fail while processing a message, so the original event message must be preserved for root cause analysis.

What architecture will meet these requirements without changing the workflow?

- A.** Configure the Amazon SNS topic to invoke the Lambda function synchronously.
- B.** Subscribe an Amazon SQS queue to the Amazon SNS topic and trigger the Lambda function from the queue.
- C.** Configure a Dead Letter Queue for the Amazon SNS topic.
- D.** Configure Lambda to write failures to an SQS Dead Letter Queue.

**Answer: D**

#### **NEW QUESTION: 2**

A user has created photo editing software and hosted it on EC2. The software accepts requests from the

user about the photo format and resolution and sends a message to S3 to enhance the picture accordingly. Which of the below mentioned AWS services will help make a scalable software with the

AWS infrastructure in this scenario?

- A.** AWS Elastic Transcoder
- B.** AWS Simple Queue Service
- C.** AWS Glacier
- D.** AWS Simple Notification Service

**Answer: B**

Explanation:

Amazon Simple Queue Service (SQS) is a fast, reliable, scalable, and fully managed message queuing service. SQS provides a simple and cost-effective way to decouple the components of an application. The user can configure SQS, which will decouple the call between the EC2 application and S3. Thus, the application does not keep waiting for S3 to provide the data.
