VLAN hopping is a computer security exploit, a method of attacking networked resources on a virtual LAN (VLAN). The basic concept behind all VLAN hopping attacks is for an attacking host on a VLAN to gain access to traffic on other VLANs that would normally not be accessible. There are two primary methods of VLAN hopping: switch spoofing and double tagging.

Double Tagging can only be exploited when switches use "Native VLANs". Double Tagging can be mitigated by either one of the following actions:

+ Simply do not put any hosts on VLAN 1 (The default VLAN)

+ Change the native VLAN on all trunk ports to an unused VLAN ID Source:
