### **NEW QUESTION: 1**

What are the main classes of biometric characteristics? Each correct answer represents a complete solution. Choose two.

- A. Fundamental
- B. Psychological
- C. Physiological
- D. Behavioral

**Answer: C,D**

### **NEW QUESTION: 2**

A developer implements a system in which transfers of goods are monitored. Each transfer needs a unique ID for tracking purposes. The unique ID is generated by an existing system which is also used by other applications. For performance reasons, the transaction that gets the unique ID should be as short as possible. The scenario is implemented in four steps which are implemented in four business methods in a CMT session bean:

These methods are called by the addTransfer method of a second CMT session bean in the following order:

checkGoods, getUniqueld, checkAmount, storeTransfer

Assuming no other transaction-related metadata, which is the correct set of transaction attributes for the methods in the session beans?

- A. 0.addTransferREQUIRED 1.checkGoodsREQUIRED 2.getUniqueldREQUIRED 3.checkAmountsREQUIRED 4.storeTransferREQUIRED
- B. 0.addTransferNOT\_SUPPORTED 1.checkGoodsREQUIRED 2.getUniqueldREQUIRES\_NEW 3.checkAmountsNOT\_SUPPORTED 4.storeTransferMANDATORY
- C. 0.addTransferREQUIRED 1.checkGoodsREQUIRED 2.getUniqueldREQUIRES\_NEW 3.checkAmountsNOT\_SUPPORTED 4.storeTransferMANDATORY
- D. 0.addTransferREQUIRED 1.checkGoodsREQUIRED 2.getUniqueldREQUIRES\_NEW 3.checkAmountsNEVER 4.storeTransferMANDATORY

**Answer: C**

Explanation:

Step 2: Must start a new transaction. use REQUIRES\_NEW

Step 3: No need for this step: use Not Supported

Use the `NotSupported` attribute for methods that don't need transactions. Because transactions

involve overhead, this attribute may improve performance.

Step 4: Use `Mandatory`:

Use the `Mandatory` attribute if the enterprise bean's method must use the transaction of the client.

Note:

\*In an enterprise bean with container-managed transaction (CMT) demarcation, the EJB container sets the boundaries of the transactions. You can use container-managed transactions with any type of enterprise bean: session, or message-driven. Container-managed transactions simplify development because the enterprise bean code does not explicitly mark the transaction's boundaries. The code does not include statements that begin and end the transaction.

\*A transaction attribute can have one of the following values:

`Required`

`RequiresNew`

`Mandatory`

`NotSupported`

`Supports`

`Never`

\*`Required` Attribute If the client is running within a transaction and invokes the enterprise bean's method, the method executes within the client's transaction. If the client is not associated with a transaction, the container starts a new transaction before running the method.

The `Required` attribute is the implicit transaction attribute for all enterprise bean methods running with container-managed transaction demarcation. You typically do not set the `Required` attribute unless you need to override another transaction attribute. Because transaction attributes are declarative, you can easily change them later.

\*`RequiresNew` Attribute If the client is running within a transaction and invokes the enterprise bean's method, the container takes the following steps:

Suspends the client's transaction

Starts a new transaction

Delegates the call to the method

Resumes the client's transaction after the method completes

If the client is not associated with a transaction, the container starts a new transaction before running the method.

You should use the `RequiresNew` attribute when you want to ensure that the method always runs within a new transaction.

\*`Mandatory` Attribute If the client is running within a transaction and invokes the enterprise bean's method, the method executes within the client's transaction. If the client is not associated with a transaction, the container throws the `TransactionRequiredException`.

Use the `Mandatory` attribute if the enterprise bean's method must use the transaction of the client.

\*`NotSupported` Attribute If the client is running within a transaction and invokes the enterprise bean's method, the container suspends the client's transaction before invoking the method. After the method has completed, the container resumes the client's transaction.

If the client is not associated with a transaction, the container does not start a new transaction before running the method.

Use the `NotSupported` attribute for methods that don't need transactions. Because transactions involve overhead, this attribute may improve performance.
